

# Network Layer

Instructor: C. Pu (Ph.D., Assistant Professor)

Lecture 15

*puc@marshall.edu*

# Network Layer Functions

---

*Recall: two network-layer functions:*

- *forwarding*: move packets from router's input to appropriate router output *data plane*
- *routing*: determine route taken by packets from source to destination *control plane*

*Two approaches to structuring network control plane:*

- per-router control (traditional)
- logically centralized control (software defined networking)

# Per-router Control Plane

Individual routing algorithm components *in each and every router* interact with each other in control plane to compute forwarding tables

# Logically Centralized Control Plane

A distinct (typically remote) controller interacts with **local control agents (CAs)** in routers to compute forwarding tables

# Routing Protocols

---

- ***Routing protocol goal:***
  - determine “**good**” paths (equivalently, routes), from sending hosts to receiving host, through network of routers
- **path:**
  - sequence of routers packets will traverse in going from given initial source host to given final destination host
- “good”: least “cost”, “fastest”, “least congested”
- routing: a “top-10” networking challenge!

# Routing Protocols

---

- A host is attached directly to one router, the **default router** for the host.
- Whenever a host sends a packet, the packet is transferred to its default router.
- We refer to the default router of the source host as the **source router** and the default router of the destination host as the **destination router**.
- The problem of routing a packet from source host to destination host  
==  
the problem of routing the packet from source router to destination router

# Graph Abstraction

Graph:  $G = (N, E)$

$N = \text{set of routers} = \{ u, v, w, x, y, z \}$

$E = \text{set of links} = \{ (u,v), (u,x), (v,x), (v,w), (x,w), (x,y), (w,y), (w,z), (y,z) \}$

# Graph Abstraction: Cost

- $c(x, x')$  = cost of link  $(x, x')$

- e.g.,  $c(w, z) = 5$

- cost could always be 1, or inversely related to bandwidth, or inversely related to congestion

Cost of path  $(x_1, x_2, x_3, \dots, x_p) = c(x_1, x_2) + c(x_2, x_3) + \dots + c(x_{p-1}, x_p)$

Question: What's the least-cost path between u and z ?

Routing algorithm: algorithm that finds least-cost path

# Routing Algorithm Classification

---

## Global or decentralized information?

### Global routing algorithm:

- all routers have complete topology, link cost info
- “link state” algorithms

### Decentralized routing algorithm:

- router knows physically-connected neighbors, link costs to neighbors
- iterative process of computation, exchange of info with neighbors
- “distance vector” algorithms

## Static or dynamic?

### Static routing algorithm:

- routes change slowly over time

### Dynamic routing algorithm:

- routes change more quickly
  - periodic update
  - in response to link cost changes

# A Link-State Routing Algorithm

---

## Dijkstra's algorithm

- net. Topology and link costs known to all nodes
  - accomplished via “link state broadcast”
  - all nodes have same info.
- compute least cost paths from one node (“source”) to all other nodes
  - gives forwarding table for that node
- iterative: after  $k$  iterations, know least cost path to  $k$  dest.'s

## Notation:

- $c(x, y)$ : link cost from node  $x$  to  $y$ ;  $= \infty$  if not direct neighbors
- $D(v)$ : current value of cost of path from source to dest.  $v$
- $p(v)$ : predecessor node along path from source to  $v$
- $N'$ : set of nodes whose least cost path definitively known

# Dijkstra's Algorithm

---

```
1 Initialization:
2  N' = {u}
3  for all nodes v
4    if v adjacent to u
5      then D(v) = c(u,v)
6    else D(v) = ∞
7
8 Loop
9  find w not in N' such that D(w) is a minimum
10 add w to N'
11 update D(v) for all v adjacent to w and not in N' :
12   D(v) = min( D(v), D(w) + c(w,v) )
13 /* new cost to v is either old cost to v or known
14  shortest path cost to w plus cost from w to v */
15 until all nodes in N'
```

# Dijkstra's Algorithm: Example

Step	N'	D(v),p(v)	D(w),p(w)	D(x),p(x)	D(y),p(y)	D(z),p(z)
0	u	2,u	5,u	1,u	$\infty$	$\infty$
1	ux	2,u	4,x		2,x	$\infty$
2	uxy	2,u	3,y			4,y
3	uxyv		3,y			4,y
4	uxyvw					4,y
5	uxyvwz					

# Dijkstra's Algorithm: Example (cont.)

Resulting shortest-path tree from u:

Resulting forwarding table in u:

destination	link
v	(u,v)
x	(u,x)
y	(u,x)
w	(u,x)
z	(u,x)
